UK General Election Results

No overall majority for conservatives!

Quality improvement for healthcare

"Every hospital should follow every patient it treats long enough to determine whether the treatment has been successful, and then to inquire 'if not, why not' with a view to preventing similar failures in the future."

Ernest Amory Codman, 1914

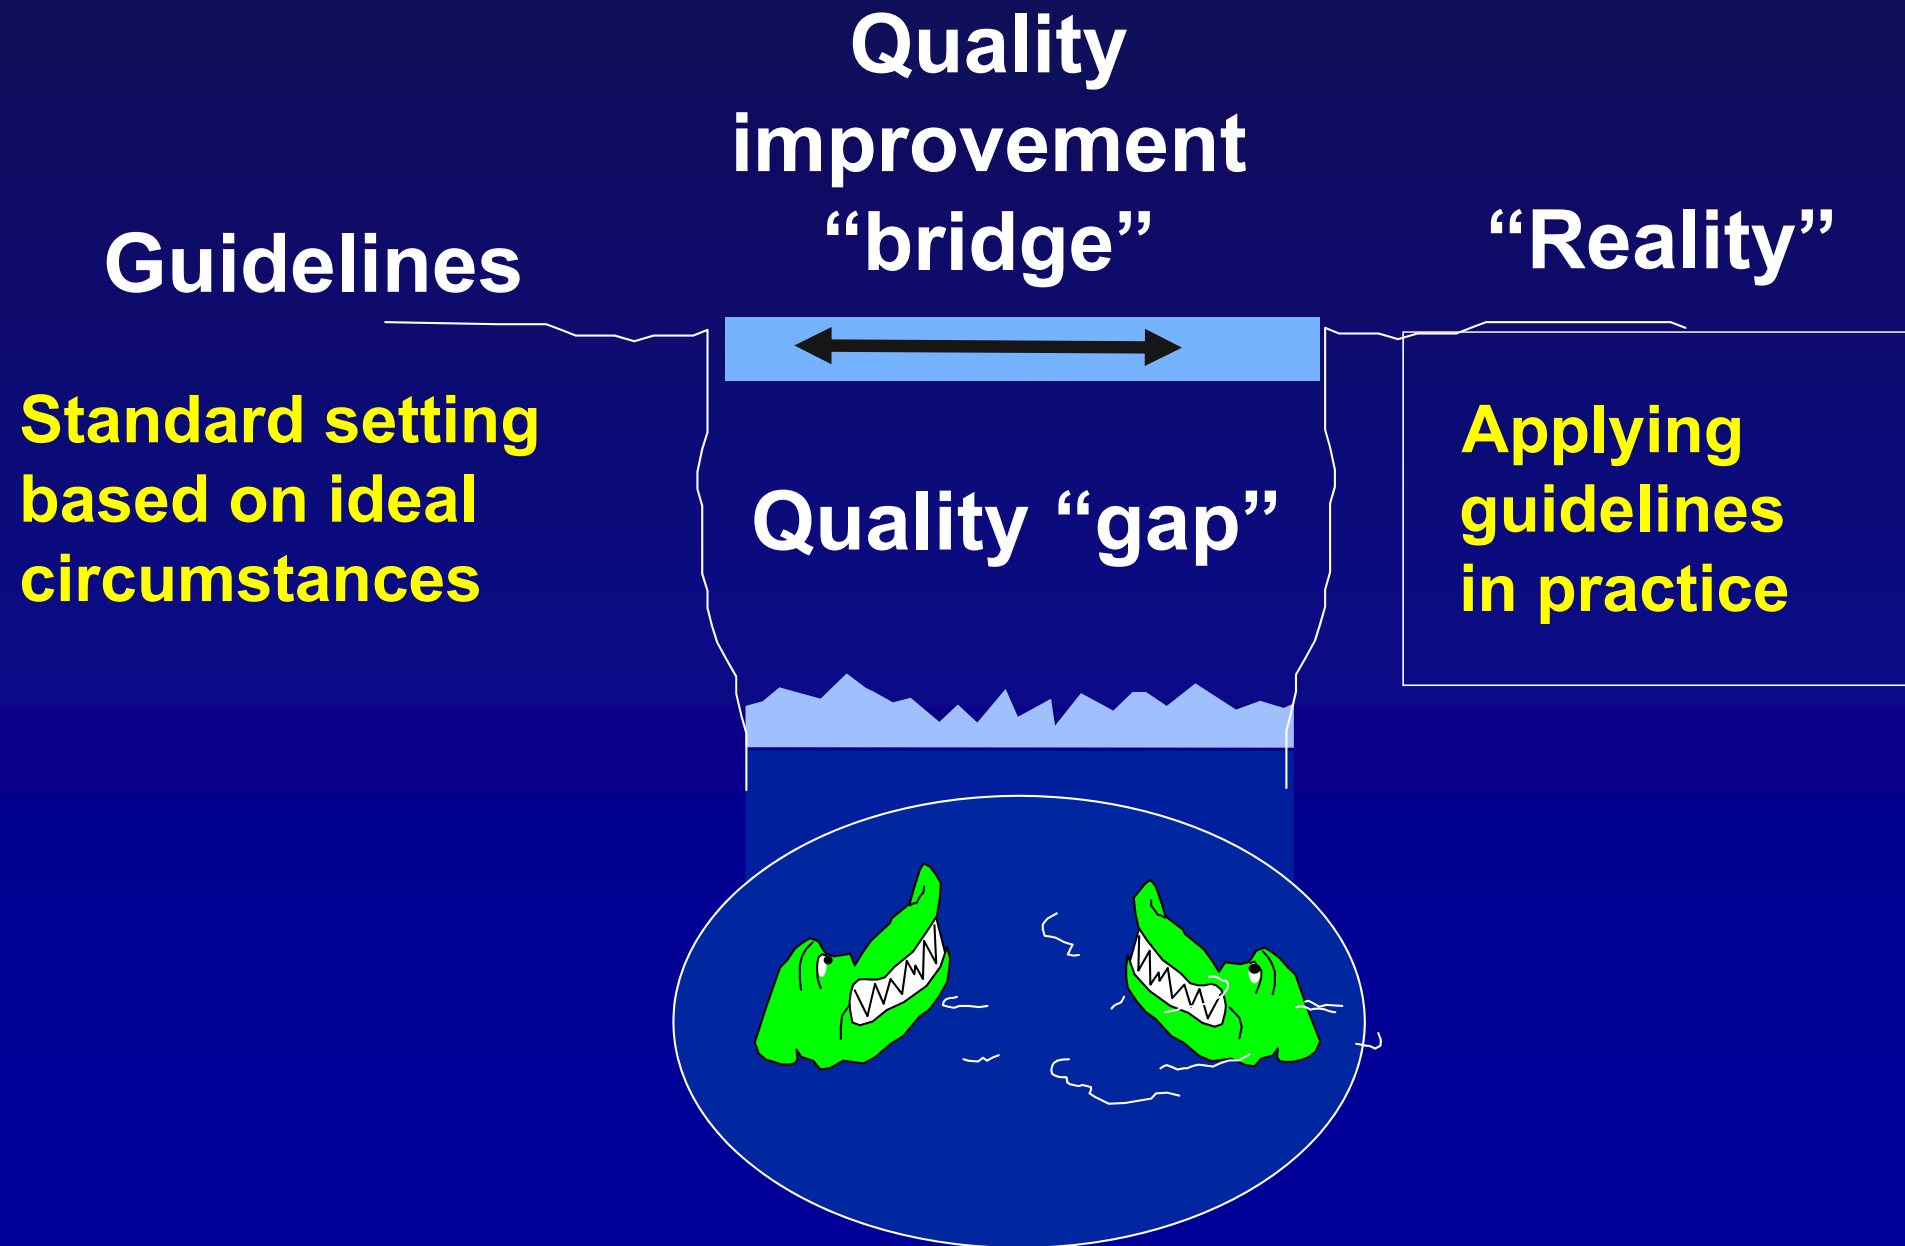

"It is not possible to learn without measuring, but it is possible - and very wasteful - to measure without learning"

"There is a tendency to bury evidence of errors and flaws, instead of revealing and studying it in the service of improvement"

Donald Berwick 2010

Why do we need quality improvement?

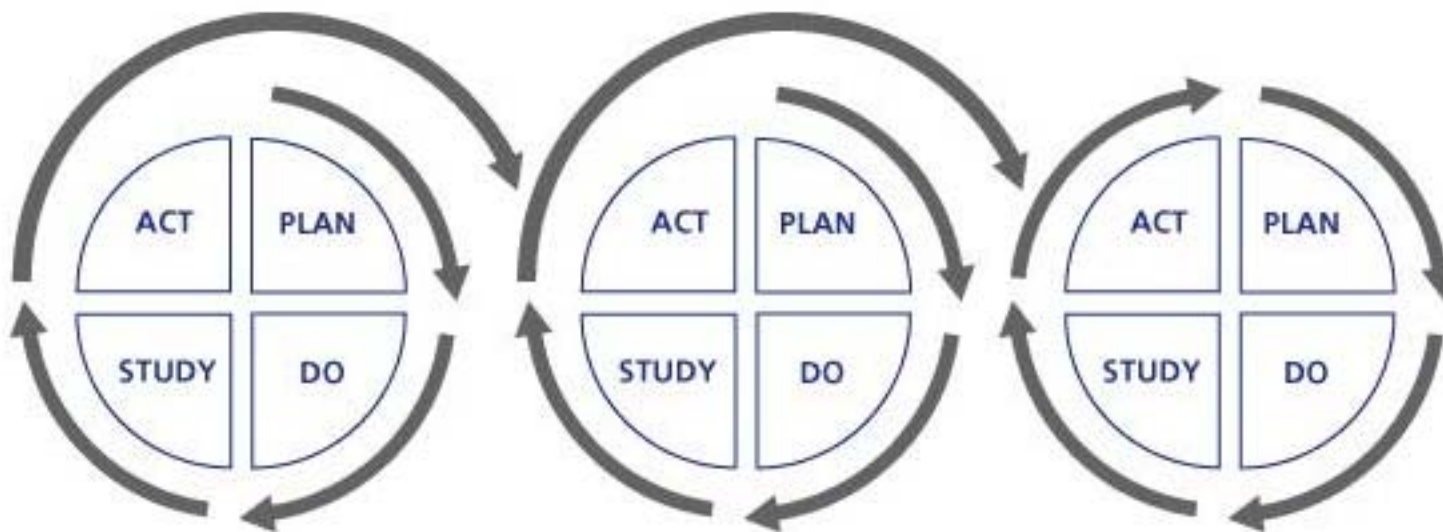

Setting the target

% achieving quality standard

Quality Improvement (QI) methods

- Based on industry models
- Focus on workers, technology, customers, process, systems
- Range of tools and approaches – some examples

Quality of care improvement cycle

Models

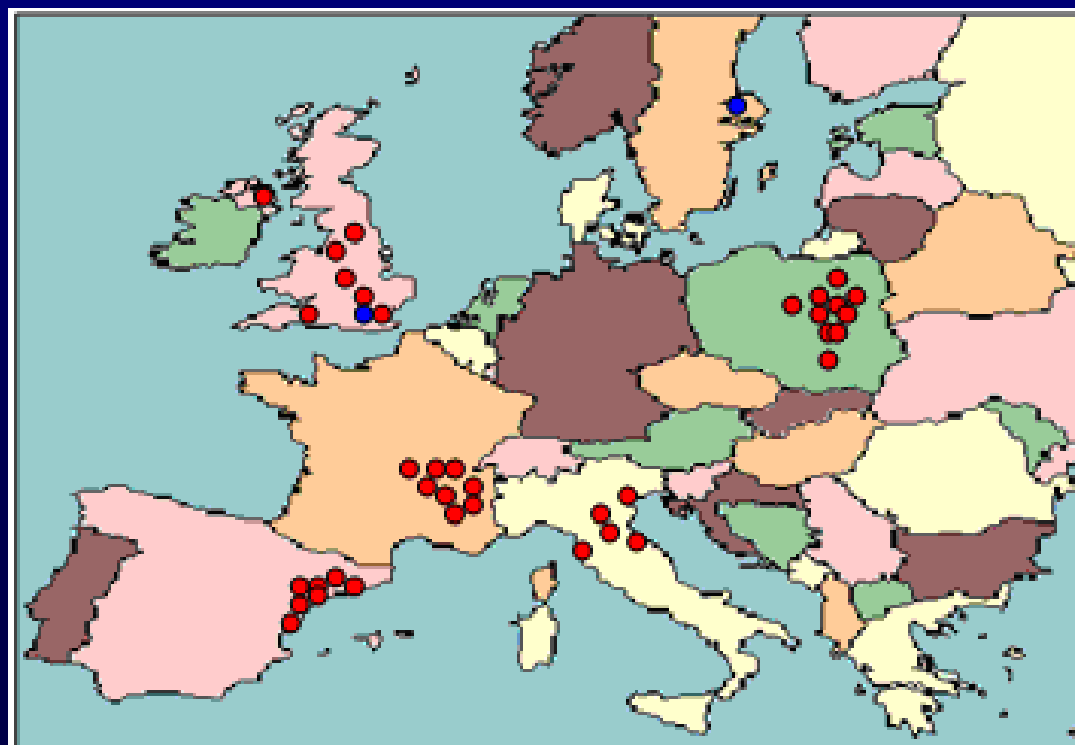

Quality principles applied to health care as a service delivery activity

- Certified guidelines set the standards ✓
- Products (medicines and devices) are tested, regulated and certified before they can be used ✓
- Health professionals generally have appropriate training and qualifications ✓
- Health care organisations usually not certified X
- Health care procedures usually not certified X
- Information systems to review quality of care generally inadequate X
- Quality improvement not embedded in practice X

European Quality Improvement Programme for Acute Coronary Syndromes: *EQUIP-ACS*

- Quality improvement (QI) programme for non ST elevation acute coronary syndromes
- Research grant from GSK (Euros 600K)
- Cluster randomised to QI or no QI programme
- Primary outcome was change in quality indicators
- 38 hospitals in 5 countries
- 12 months recruitment
- 4400 patients enrolled

Flather et al Am Heart J. 2011
Oct;162(4):700-707.e1.

Clinical Trials &
Evaluation Unit

Quality improvement intervention

- 3 one-day meetings held over 4-month period (Amsterdam, London)
- 2 members of staff (“Local Champions”) from each QI centre attended
 - Meeting 1: Analysis of current work processes, setting goals, measurement methods
 - Meeting 2: measuring performance, improvement ideas, PDSA & other established QI tools
 - Meeting 3: Results, further improvement work, reliable work processes- sustainability
 - Analysis of local situation and implementation plans

Reactions to challenging data

1. The data are wrong
2. The data are right, but it's not a real problem
3. The data are right, it's a real problem but it's not my problem
4. The data are right and it's my problem

Don Berwick 2003

EQUIP ACS: Primary outcome

(risk stratification, Cor angio, anticoagulant, statin, beta blocker, ACE-I, clopidogrel) ESC 2010

% achieving quality indicator

Quality improvement in heart failure

- Heart failure is common and is associated with high risk of death, hospital admission and readmissions
- High burden of health care costs
- Achieving high quality care (doing what we should be doing) could provide large benefits
- Observational studies provide evidence of benefit of quality improvement
- **HOWEVER:** lack of robust evidence base to support quality improvement leads to poor uptake and financial investment

Guideline based quality indicators in heart failure

- Based on the European Society of Cardiology Heart Failure Guidelines
- Level of evidence (A,B, C) based on published research: large randomised trials provide high levels of evidence = A
- Class of recommendation: expert opinion on whether a treatment should be given (I, II, III), I is highest class

Quality indicator	Level of evidence	Class of recommendation
Angiotensin Converting Enzyme Inhibitor	A	I
Beta blocker	A	I
Mineral Corticoid Receptor Antagonist	A	I
Angiotensin Receptor Neprilysin Inhibitor	B	I
Implantable Cardioverter Defibrillator	A	I
Cardiac Resynchronisation therapy	A	I

8. *European Journal of Heart Failure* Ponikowski, Piotr et al. "2016 ESC Guidelines For The Diagnosis And Treatment Of Acute And Chronic Heart Failure".

Observational Quality Improvement programmes are associated with improved outcomes

Observational data exploring QI and outcomes in USA

A 10% of improvement in composite care was associated with a 13% lower odds of 24month mortality.

Association between Heart Failure Quality Indicators and mortality

6. Associations Between Outpatient Heart Failure Process-of-Care Measures and Mortality Gregg C et al Circulation. 2011;123:1601-1610,

Cluster-Randomized Trial of Personalized Site Performance Feedback in Get With The Guidelines-Heart Failure

Adam D. DeVore, MD; Margueritte Cox, MS; Paul A. Heidenreich, MD, MS;
Gregg C. Fonarow, MD; Clyde W. Yancy, MD; Zubin J. Eapen, MD, MHS;
Eric D. Peterson, MD, MPH; Adrian F. Hernandez, MD, MHS

- Large cluster randomised US based study 147 hospitals and 70,000 patients
- Provided a personalised site feedback as the intervention in heart failure centres
- No change in estimate of quality of care from baseline to 12 months
- Interpretation: providing additional information to sites is not sufficient to change practice

Circulation: Cardiovascular Quality and Outcomes. 2015;8:421-427

Reducción de ingresos y visitas a Urgencias en pacientes frágiles con insuficiencia cardíaca: resultados del programa asistencial UMIPIC

Reduction in hospitalisations and emergency department visits for frail patients with heart failure: Results of the UMIPIC healthcare programme

J.M. Cerqueiro ^{a,*}, A. González-Franco ^b, M. Montero-Pérez-Barquero ^c, P. Llácer ^d, A. Conde ^e, M.F. Dávila ^f, M. Carrera ^g, A. Serrado ^h, I. Suárez ⁱ, J. Pérez-Silvestre ^j, J.A. Satué ^k, J.C. Arévalo-Lorido ^l, A. Rodríguez ^m, A. Herrero ⁿ, R. Jordana ^o, L. Manzano ^p

RICA Registry overview

- Observational study, set up in 2008
- 50 hospitals rising to 70 hospitals, 5500 patients
- Enrolling heart failure admissions aged >50 years, ESC criteria of HF, discharged alive
- Data entered on web based case report form, central checking and analysis
- Sponsored and part funded by SEMI with funding from industry and other sources
- Academically led
- Aim is to understand heart failure demographics and treatments, prognosis and improve care

RICA assessment of impact

- Collaborating centres include a range of health care institutions – increases generalisability, information exchange and quality improvement
- ~ 30 publications at National/ European level
- Insights into patient characteristics and prognosis
- Development of a risk model
- Practice changes: introducing dedicated HF services e.g. UMIPIC, increase in evidence based treatments e.g. anticoagulation for AF

Protocol for a cluster randomised trial to evaluate the effects of a quality improvement programme on outcomes in heart failure

Juan Gallego Galiana

Rafael Martinez Fernandez

Manuel Montero Perez Barquero

Luis Manzano

James Pearson

Marcus Flather

Changing attitudes and behaviour is key to quality improvement

- Quality improvement has to be a core activity
- Incentives for improved performance
- Penalties for poor performance
- Information systems that record information and provide appropriate reports
- Understanding attitudes and behaviours of organisation, staff, patients and families
- Quality improvement needs to be evidence based

Acknowledgments

- RICA study group: Manuel Montero-Perez Barquero, Luis Manzano, and RICA Steering Committee
- Rafael Martinez Fernandez, Juan Gallego Galiana, James Pearson
- Organising Committee of SADEMI

Outcomes

Primary

- Composite of death rate and all cause mortality at or unplanned hospital admission for heart failure at one year

Secondary

- Patient based outcome e.g. Minnesota living with heart failure questionnaire
- Difference in use of quality indicators at baseline and at endpoint within group and between groups

Sample size estimation principles

Sample size estimation for cluster randomised trials is much more complex than RCT's. Two important concepts are:

- Cluster RCT's are randomised at the hospital level even though the outcomes are measured at the patient level
- Need to measure the "Intra-cluster correlation coefficient" – The variability of treatment in a centre

Using :

- Alpha error: 0.05
- Beta error: 0.20

We estimate we will need 100 hospitals enrolling around 10,000 patients to detect a 15% reduction in risk of our primary outcome at 12 months

Results

- The most promising interventions were piloted as improvements
 - Scaled up based on success and patient interest
- Examples:
 - Patient education materials
 - Evidence-based provider order sets
 - Nursing and provider education
 - Teach back tools
 - Motivational interviewing training
 - Mechanisms for close outpatient follow up
 - Collaboration with home care and local nursing homes

Results

- No statistically significant differences in pre- and post-intervention groups
- Rate of 30-day all cause readmissions for HF declined from 28.4% to 18.9% ($p < 0.01$)
- This lead to an estimated reduction in charges of about \$900,000 dollars

La Unidad de Insuficiencia Cardíaca y Riesgo Vascular de MI (UICARV)

Fundamento

1. Enfermedades CV. Principal causa de morbimortalidad

2. IC. Principal causa hospitalización > 65 años

3. IC. Prevalencia, 10% de los > 70 años. Envejecimiento

4. IC anciano. Paciente pluripatológico típico

5. Atención fragmentada. Ineficiencia sistema sanitario

UICARV. Consulta

Criterios de derivación

1. Pacientes de edad avanzada (> 70 años)

2. Suficiente capacidad física y mental, o cuidador

3. Diagnóstico verosímil de insuficiencia cardiaca

4. No seguimiento específico por Cardiología

5. Ingreso o visita previa a Urgencias

Anamnesis

Se mantiene con disnea de minimos esfuerzos, aunque el edema en MMII ha bajado levemente. Dsde el 20/12 esta durmiendo con 3 almohadas, sin haber vuelto a tener episodios de DPN. La tos ha disminuido así como la expectoracion, tras el inicio del tratamiento con levofloxacino, pero desde hace 3 dias expectoracion hemoptoica. No ha tenido fiebre. No dolor torácico o palpitations Dieta sin sal. No se ha tomado la TA desde la ultima visita. No ha habido cambios en el tratamiento. Ha bajado 2.4 kilos.

Exploración

Eupneico. AP: mvc; crepitantes en bases bilateral. AC: tonos apagados, no soplos, . Abdomen: (sentado) no doloroso EEII: Edema maleolar y hasta tercio medio - superior bilateral

 Gasometria venosa: pHv: 7.38, pO₂v: 15 mmHg, pCO₂v: 50 mmHg, CO₃Hv: 29.00 mM/L
 * RX torax: (28/12/10): Cradiomegalia. Derrame pleural derecho basal Redistribucion vascular.

Diagnóstico

- Alergia a amoxicilina. Tendinopatia aquilea 2º a adminstracion prolongada de levofloxacino
- Hipertensión arterial. Actualmente tendencia a la hipoTA por lo que ha sido necesario suspender el perindopril tras episodio presincopal.
- Diabetes mellitus en tratamiento con ADOs. Buen control
- Gota hiperuricémica.
- Miocardiopatia dilatada de origen isquémico. Insuficiencia cardiaca sistólica.ECO (8/2010): AI dilatada VI dilatado con disfuncion sistolica severa con la contractilidad a expensas de

Tratamiento

Recetas

Vademecum

- Dieta sin sal.
- * Furosemida 40 mg, 2 comprimidos por la mañana y 2 a mediodia. Durante 2 dias tomara un comprimido mas extra
- * Higrotona 50 mg, 1 comprimido al día.
- * Coroprés 25 mg, 3/4 comprimido por la mañana y 3/4 por la noche
- * Nitroplast 10, 1 parche de 9 a 23 horas.
- * Potasion capsulas 3 capsulas con desayuno, 3 con comida y 3 con cena
- * Sintrom 4 mq, ajuste de dosis por Hematología.

Consejos Paciente

Mala evolucion. Ha disminuido algo el edema, aunque persiste edema notable y cierto derrame pelura dercho y ademas se ha producido cierto deterioro de funcion renal. Ademas el paciente presenta una sobredosificacion de sintrom, con esputos hemoptoicos. Enviamos al paciente a urgencias para reversion de la anticoagulacion y ajuste del tratamiento diurético. Se ha comentado el problema de la I renal con la familia y estan de acuerdo, dado el deterioro global del paciente el manejo exclusivamente conservador. Asimismo se retira al paciente del estuido Red HF dado el deterioro global de este

Principles of quality

- Frequently discussed and poorly understood in context of health care
- Principles based on provision of goods and services in commercial sectors e.g. cars
- “High” quality means that the product meets pre-specified standards and expectations:
- Production and delivery are carried out according to accessible protocols
- All procedures are subject to internal and external inspections
- Certification by external authorities

Results as trends

EQUIP Primary outcome

Composite of 8 measures developed from the European 2007 guidelines for non ST - segment elevation Acute Coronary Syndromes:

1. Formal risk stratification
2. Appropriate coronary angiography in intermediate to high risk patients <72 hours
3. Anticoagulation for all patients
4. Beta-blockers at discharge for those with EF<50%
5. Statins within 4 days for all
6. ACE inhibitors at discharge (impaired EF, hypertension, diabetes, impaired renal function)
7. Clopidogrel loading dose on admission
8. Clopidogrel at discharge is confirmed ACS

Use of risk stratification
